

Weilin Lu

Q1&Q2

The orange points are year2 and the blue points are year 1

For the year one line equation is: $y = -0.0091x + 17.247$

Q3

We can see the line of the first year is decreasing but the second year increase a lot. So for the strategy, both of long and short is possible. I prefer short one. I can buy in at a stating price. If second day open price is higher than the price i bought in, i will sell it. If not, i will keep it. I like the combination of long and short strategy
